OBSERVATION INFORMATION

Species	Date(s) Observed	Spawning	Rearing	Present	Anadromous
Dolly Varden	8/6/00		x		<input type="checkbox"/>
Red Salmon	8/6/00			x	<input checked="" type="checkbox"/>
King Salmon	8/6/00			x	<input checked="" type="checkbox"/>
Pink Salmon	8/6/00			x	<input checked="" type="checkbox"/>
Coho Salmon	8/6			x	x
Chum Salmon	8/6/00			x	<input checked="" type="checkbox"/>

**IMPORTANT:** Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

**Comments:**

Please see the attached document "Cutthroat Trout Distribution and Abundance" for supporting documentation.

HABITAT AND RESTORATION  
DIVISION

Dear Sir:

The Glacier Ranger District conducted stream surveys on 19 streams in Prince William Sound (PWS) during the 2000 field season. Of those systems sampled the survey identified undocumented fish species in two basins in Jackpot Bay (ADF&G 226-20-16080-0020, 226-20-16090-999), three tributaries to Squaw Bay (ADF&G 222-30-12920, 222-30-199, and 222-30-199), one inlet to Nassau Fiord (ADF&G 226-20-194), one inlet stream to Port Wells (ADF&G 223-20-199), and two inlet streams to Puffin Cove (ADF&G 226-50-16106, 226-50-16098). Methodology to surveys conducted included minnow trapping, snorkel counts and hook-line. The results of these surveys indicate that a number of streams surveyed hold species of both adult and juvenile salmon, trout and char that are either missing from the Anadromous Waters Catalog or have partial coverage within the system.

Specifically, those undocumented species trapped within the Jackpot system comprised 654 juvenile coho salmon, and 19 cutthroat trout. Within the upper portion of the basin 235 juvenile Dolly Varden char were found in a previously undocumented region. A total of 121 adult coho, 3 king salmon and 16 cutthroat trout were observed or sampled by hook and line. Sampling was conducted on a small, unnamed basin in Jackpot Bay. Results of minnow trapping resulted in nine juvenile Dolly Varden and 11 juvenile cutthroat trout.

Streams surveyed in Squaw Bay were snorkeled and the fish species identified included (ADF&G 222-30-12920) 143 cutthroat trout found throughout the system. Additionally, one adult cutthroat trout was caught by hook and line. Another unnamed stream snorkeled in Squaw Bay (ADF&G 222-30-199) identified 5 juvenile coho salmon, one juvenile king and 5 juvenile cutthroat trout. The last stream in Squaw Bay was an unnamed stream (ADF&G 222-30-199) that was sampled by hook and line. A total of 15 adult cutthroat trout were identified in this system.

Trapping and snorkeling techniques were used on two streams in Puffin Cove. The first stream sampled (ADF&G 226-50-16106) using minnow traps caught 197 juvenile coho salmon and 55 Dolly Varden. Snorkeling produced 196 juvenile coho and 11 Dolly Varden. Adult red salmon totaling 67 fish were observed throughout the system. The second system sampled (ADF&G 226-50-16098) with minnow traps found 139 juvenile Dolly Varden, and snorkeling produced 836 Dolly Varden. A total of 6 adult Dolly Varden were sampled by hook and line.

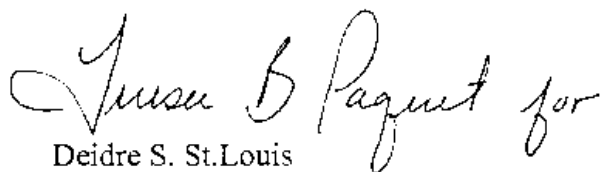

One stream in Nassau Fiord was snorkeled and found 213 juvenile Dolly Varden and 1,760 juvenile coho salmon. Adult salmon totaling 2,000 pink and an undetermined amount of chum salmon were observed.

The last system sampled in PWS was an unnamed stream on the east side of Port Wells. Snorkel surveys indicated the presence of juvenile Dolly Varden.

If you have any questions please contact Rob Spangler, District Biologist at 754-2325.

Sincerely,

A handwritten signature in cursive script that reads "Deidre S. St. Louis for". The signature is written in dark ink and is positioned above the printed name and title.

### **Individual Drainages**

The following section describes the results from individual drainages surveyed. The order followed is the order that the drainages were surveyed. Names in quotes are the given / non-official name of these streams. See figures (Bar Graphs) in the appendices that list the Catch Per Unit Effort (CPUE) for snorkeling and minnow trapping streams, and for snorkeling, minnow trapping and rod and reel sampling for each lake. Not all drainages are included in the figures because not all systems were surveyed in the same fashion. For example, only the first three streams and lakes were minnow trapped. Icy Creek (see individual drainages below) was excluded from the Stream CPUE: Snorkeling figure (Bar graph) because of the high CPUE (15.045) for Coho. The high value masked the smaller CPUE values on the figure.

**"Two Bear"** - Alaska Dept. of Fish and Game Stream # 226-50-16106 (ADFG, 1989)

Flows into Puffin Cove - Port Bainbridge

No cutthroat were found in this system.

Stream / downstream of lake - Minnow trapping (902 min.) and snorkeling (70 min.) were used to survey the stream, with snorkeling having a higher CPUE than trapping for all species. More coho were observed than Dolly Varden. Reds, pinks and Dolly Varden were observed up to a potential barrier into the lake - a 4' falls into a plunge pool where Dolly Varden were holding.

Lake - Minnow trapping (1471 min.) snorkeling (136 min.) and rod and reel sampling (958 min.) were used to survey the lake. Minnow trapping caught coho and Dolly Varden, snorkeling had the highest CPUE and observed coho and red juveniles, and rod and reel caught 2 adult Dolly Varden and one juvenile coho.

**"Circus"** - Alaska Dept. of Fish and Game Stream # 226-50-16098 (ADFG, 1989)

Flows into Puffin Cove - Port Bainbridge

No cutthroat were found in this system.

Stream / downstream of lake - Minnow trapping (2818 min.) and snorkeling (360 min.) were used to survey the stream, with snorkeling having a higher CPUE (2.644) than trapping (.086). Many more Dolly Varden were observed than Coho. The upper stream may seasonally connect on the surface with the larger "Dolly" Lake that flows away from Puffin Cove into Whale Bay. At the time of survey the upper stream was intermittent with no connection to "Dolly" Lake.

Adult pinks, chum, reds and Dolly Varden were present in the stream.

Lake - The "lake" was more of a small pond type feature between the upper and lower stream reaches. The lake margin was minnow trapped (903 min), and fished (146 min) with snorkeling effort included in the stream data. Fishing effort had the higher CPUE than trapping. Dollies were dominant in the system. The pond received subsurface flows from nearby glacial systems (cold water).

**"Dolly"** - Alaska Dept. of Fish and Game Stream # 226-20-16300 (ADFG, 1989)

Flows into Whale Bay

No cutthroat were found in this system.

Stream / downstream of lake - Minnow trapping (4511 min.) and snorkeling (176 min.) were used to survey the stream, with snorkeling having a higher CPUE than trapping. Pinks, chum and Dolly Varden were observed in the stream. Has the highest total CPUE of stream in the surrounding drainages.

Lake - The lake was rod and reel sampled (314 min.) with only Dolly Varden being caught. Pink red, chum, 2 king salmon and Dolly Varden were observed in the lake.

**"Killer Willow"** - Alaska Dept. of Fish and Game Stream # 226-50-16101 (ADFG, 1989)

Flows into Puffin Cove - Port Bainbridge

No cutthroat were observed in this system.

Stream / downstream of lake - The stream was snorkeled (258 min.) finding a larger number of coho than Dolly Varden. A small falls and cascade may form a barrier into the upper reaches of the stream.
